

Abstract

[PROBLEMS] To prevent privacy invasion performed according to a proper identifier which has been read.

[MEANS FOR SOLVING PROBLEMS] A pseudo-RFID transmission

5 device for transmitting a pseudo identifier (RFID) for disturbing an invader is provided to an individual user.

When an RFID transmission instruction is received from a tag reader (SAI), a variable type pseudo RFID different

from the one which has been transmitted previously is

10 transmitted (SA3 to SA5) and different RFID is transmitted

each time for the same person. The respective pseudo RFID

transmission devices are grouped into a plurality of types,

so that the pseudo RFID transmission devices belonging to

the same group transmit their variable type pseudo RFID

15 while increasing the possibility to transmit common pseudo

RFID accorded with one another. An area is specified for

each group and the respective pseudo RFID transmission

devices are provided to individual users, so that the same

RFID may be transmitted for the same person.
